TITLE : METHOD FOR MAKING WATER
TURBID

ABSTRACT : PURPOSE: To make water highly turbid by dissolving a gas in water under pressurized conditions, and then instantaneously releasing the water under reduced-pressure conditions.

CONSTITUTION: Air is injected by an air feeder 3 into the transparent water W supplied to a pressure vessel 1 from a water feeder 2 through a water supply pipe (a). The pressure in the pressure vessel 1 is increased to a specified pressure to dissolve the air in the water W. The water contg. dissolved air is released through a throttle valve mechanism 4 such as an orifice into the outside kept at a pressure lower than the pressure in the pressure vessel 1 to supersaturate and vaporize the dissolved air. The water feeder 2 is provided with a water tank 21, a high-pressure water feed pump 22, and a pump driving motor 23, and the atomized water is supplied into the pressure vessel 1 from the top. By this method, the turbidity of the water is kept for a long time.
